Phone: +91 00000 00101
Location: Hyderabad, Telangana, India

Professional Summary

Recent B.Tech graduate in Computer Science and Engineering (Data Science specialisation) with a six-month data science internship centred on churn modelling, exploratory analysis and Power BI reporting. Comfortable cleaning messy tabular data in Pandas, writing SQL with joins and window functions, and building baseline scikit-learn models with proper train/test validation. Seeking an entry-level Data Scientist or Data Analyst role.

Technical Skills

Programming: Python, SQL (MySQL, SQLite)

Data Analysis: Pandas, NumPy, exploratory data analysis, data cleaning, descriptive statistics, hypothesis testing basics

Machine Learning: Scikit-learn, logistic regression, random forest, gradient boosting (introductory), cross-validation, ROC-AUC, precision and recall

Visualization: Matplotlib, Seaborn, Power BI (basic), Excel pivot tables

Tools: Jupyter Notebook, Git and GitHub, VS Code

Work Experience

Data Science Intern - Kiran Analytics Pvt Ltd
Hyderabad, Telangana | Jan 2026 - Jun 2026

- Cleaned and merged three customer tables (about 180,000 rows) with Pandas, resolving duplicate customer IDs and standardising null handling; this cut preparation time for the weekly client report by roughly 40%.
- Built baseline logistic regression and random forest churn models for a subscription client; the random forest reached ROC-AUC 0.84 on a held-out month against 0.71 for the existing rule-based flag.
- Wrote SQL (CTEs, joins, window functions) to produce monthly cohort retention tables used by the account team.
- Built a four-page Power BI report on churn drivers that was reviewed in weekly team meetings.

Projects

Telecom Customer Churn Prediction (Capstone)

- Problem: Identify telecom subscribers likely to leave in the next quarter from a public dataset of about 7,000 customers with a 26% churn rate.
- Approach: Performed EDA, encoded categorical features, handled class imbalance with class weights and SMOTE, and compared logistic regression, random forest and gradient boosting using stratified 5-fold cross-validation.
- Technologies: Python, Pandas, Scikit-learn, imbalanced-learn, Seaborn
- Results: Best model reached recall 0.78 and ROC-AUC 0.86; tenure, contract type and monthly charges were the strongest drivers.

Retail Sales Analysis Dashboard

- Problem: Give a small retailer a clear view of sales by region, category and month from a transactional CSV.
- Approach: Cleaned dates and currency fields in Pandas, created calculated measures, and built interactive Power BI visuals with drill-down by region.
- Technologies: Python, Power BI, Excel
- Results: Highlighted that two categories contributed 61% of revenue but had the lowest margins, a finding presented in the final-year project review.

House Price Prediction with Feature Engineering

- Problem: Predict residential prices for a Kaggle housing dataset with many missing and skewed fields.
- Approach: Imputed missing values, log-transformed skewed targets, engineered age and area-ratio features, and tuned a Ridge and random forest model with grid search.
- Technologies: Python, Scikit-learn, Matplotlib
- Results: Reduced RMSE by 18% compared with the baseline linear model.

Education

B.Tech, Computer Science and Engineering (Data Science), Godavari Institute of Technology, Hyderabad (2022 - 2026) - CGPA 8.4 / 10

Certifications

- Google Data Analytics Professional Certificate (Coursera, 2025)
- Python for Data Science (NPTEL, 2024)

Achievements

- Second place, inter-college data science hackathon, 2025 (team of four).
- Selected as student mentor for the department's first-year Python workshop.
